INTRODUCTION

This volume is published in the hope of increasing the meaningful exchange of information among those who develop and use technical information and those who collect, store, and publish it. It is an initial step in a study which proposes to find ways of improving information flow and use by better integrating the methods, procedures, and systems through which this interchange is accomplished.

Primarily, this effort was an attempt to list all information systems operated by or supported by the government which contain material of interest to Air Force research and development. In practice, this was broadened to include all systems of use in aerospace R&D. The definition of "information systems" was broadened to include information centers, services, and sources. This expansion allowed for the inclusion of many publications, such as lists of indexes and abstracts, as well as certain bibliographies, because of their considered importance to aerospace technology.

Most of the information sources listed in this document are historical in character. This means that they report, analyze or announce work which has been completed, and which is anywhere from six months to two years, or more, old. It must be emphasized that the most important information, from the point of view of management, planning, and work in progress is current information, because such is the basis of present applications and future plans. Work is now going forward with the aim of developing ways in which current information can be made more quickly and completely available to all potential users.

HOW THIS VOLUME IS ORGANIZED

1. GENERAL: This volume has been organized so that it will be useful from any one of several different approaches. Information systems included can be located by their given names, through cross reference to the name of the sponsoring organization, by reference to the broad subject field in which they specialize, or through the use of a conventional subject-word index.
2. INFORMATION SYSTEMS ALPHABETICAL LISTING: (Part I) - Each system is listed alphabetically in accordance with its full name or widely accepted abbreviation. Numbers are assigned each listed system to facilitate search from the subject index. Some numbers have been intentionally omitted, where it was decided, subsequent to the numbering operation, to omit or relocate a certain system. The letter suffix to some system numbers is accounted for by systems which were inserted after the original assignment of numbers.
3. CROSS REFERENCES: When an information system is widely identified with the institution or agency who sponsors, supports or houses it, it has been listed as a cross reference under the name of such institution or agency.
4. BROAD AREA LISTING: (Part II) - Some systems have sufficiently broad areas of coverage so as to make it impractical to list them in the subject index under all possible search words. In these cases, the systems are listed alphabetically under the applicable area or areas. The titles of these areas are found in the Table of Contents.
5. SUBJECT INDEX: (Part III) - Since most users will probably find the subject words best suited to their search purposes, a rather extensive cross indexed subject search list has been included. The numbers given next to the subject words refer, of course, to the number of a system listed in Part I.

NATIONAL ACADEMY OF SCIENCES - NATIONAL RESEARCH COUNCIL

The National Academy of Sciences and its National Research Council encompass all fields of science and are well qualified to deal with problems and policies that are of general significance for all science, and to foster the mutually advantageous interrelations between specialized sectors of science.

Although none of these activities can be classified as information sources, services, centers and systems within the meaning of this report, the Academy's broad interests, as well as those of its several panels, groups, committees and subcommittees are sufficiently pertinent to Air Force R&D to list them here.

In each case, the groups listed herein are organized with permanent offices and staff and are available for information and consultation in normal course of business. Some of these groups are available only for special projects or consultation by prior arrangement. Still others operate in close cooperation with specified Air Force R&D or planning activities.

Generally speaking, these groups are responsive to requests from any Government R&D activity for consideration of the feasibility of a proposed research program, project or approach. Usually, operating officials in the agency considering the program will make informal contact with the appropriate NAS-NRC group to discuss possible consultative assistance. If such exploratory contacts indicate that consultative assistance would be beneficial, formal arrangements are conducted through the heads of the agencies involved.

Contact should be made by addressing the particular group through the NAS-NRC:

2101 Constitution Avenue, Washington 25, DC
or by telephone, as indicated in the following list. In the Washington D.C. area, Government telephone codes, as follows, apply: NAS-NRC, EX 3-8100, code 148; National Institutes of Health, OL 6-4000, code 179; Library of Congress, ST 3-0400, code 173. Other information sources and services of NAS-NRC are listed throughout this report.

NATIONAL AERONAUTICS & SPACE ADMINISTRATION

Washington 25, DC

The NASA conducts a broad documentation and dissemination program for scientific and technological information in the space and aeronautical fields. Information from world-wide sources is collected, organized, and cataloged to permit its use by scientists and engineers throughout the national space and aeronautical programs. Technical information materials resulting from NASA supported work are announced, indexed and made generally available. They are disseminated automatically and by special request to official users and placed on public sale to others. Reference service is provided for requestors outside NASA programs as well as within.

NASA has four series of technical publications: (1) Technical Reports. Presentations of a body of information considered to be complete and of lasting usefulness; unclassified. (2) Technical Notes. Presentations of a more transitory nature and usually more limited in scope than Reports; unclassified. Technical Notes supplement but do not overlap Technical Reports. (3) Technical Memorandums. Classified presentations. Memos are reissued as Reports or Notes if they are declassified and if they are considered of general interest at the time of declassification; classified and unclassified. (4) Technical Translations. Presentations of information published in a foreign language; unclassified.

Firms or individuals having an official need may receive NASA publications by certifying this need to the NASA Office of Technical Information & Educational Programs, Code ETD, Washington 25, DC. Others may purchase NASA Technical Notes, and Technical Translations from the Department of Commerce, OTS. NASA Technical Reports are sold by the U.S.GPO.

NASA technical publications are announced in the following media: (1) Technical Publications Announcements (TPA). Biweekly abstract list of NASA-published documents, technical papers and articles describing NASA-supported work, AGARD reports, and selected British reports, both classified and unclassified. TPA is supplemented by the annually published Index of NASA Technical Publications. Both are available from the NASA OTI&E Programs, Code ETD, Washington 25, DC. (2) Monthly Catalog of U.S. Government Publications. Announcement list including NASA Technical Reports and other NASA publications sold through GPO. It is supplemented by GPO Price List No. 79: Aviation, which is issued periodically. (3) U.S. Government Research Reports. Announcement list including NASA Technical Notes all of which are sold through OTS. (4) Technical Translations. Announcement list including NASA Technical Translations sold through OTS.

NASA programs, and hence the NASA technical information program, cover the entire range of science and technology concerned with space and aeronautics. The broad categories of information are delineated
